Team description

SWE Squad	
Member	*Role*
Jodie Chan	Team leader/Front-end developer
Saher Ahmad	Front-end developer
Toritseju Mikie	Team coordinator/Back-end developer
Harry Nguyen	Back-end developer

Team organization:
The team will be organized as a democracy with one team leader and one team coordinator. All team members will be involved in a role with either front-end or back-end development for the project. In order to put together different components of the software, all team members are expected to research individually and come together to collaborate as a group with their research. The group will meet weekly to discuss strategies and any accomplishments/hardships that need to be addressed and devise an appropriate solution in regards to them.

Project: GSU Class scheduler
The project's main objective is to generate possible schedules for students, along with ratemyprofessor.com reviews, if applicable, based on courses the student needs to take. Courses from the Fall semester will be pulled for data to populate our database. Programming languages will be used to implement the software, such as Java, along with a database using mySQL. Students can input the courses' ID that they need to take, which would send a message to the server for an output, possible schedules without any conflicts and would also return the corresponding ratemyprofessor reviews as an output.
